Hello from Kotlin!

Open and run *First.kt.* To run it right click on *.kt* file and choose Run. You will notice console output when build process is done and application is executed.

```
fun main(args: Array<String>) {
    println("My first Kotlin application.")
}
```

This is very simple code that starts console Kotlin application and prints a line of text. We have function called *main* as entry point of our application. This function does not belong to any class. We will later talk about defining functions, passing arguments and other related stuff.
